

AI Introduction — Assignment 2

Trying an Agent on One Piece of Work

Take **one** piece of work from Assignment 1, run an Agent that can use at least one tool, and keep a record of what you asked and what came back.

Type: Individual report

Language: English

Trials: At least one complete run; a second run is encouraged

The aim is to try and keep the record. You do not need a polished system. A failed or messy trial is acceptable if the prompts and the Agent's output are kept.

Use the materials from Tutorial 2 if you have them. Do not reconstruct a trial from memory.

Safety and responsible use

Use non-confidential materials or fictional substitutes. Do not include passwords, student ID numbers, unpublished grades, confidential company data, medical records, or other people's private information.

Do not let the Agent send, publish, delete, purchase, share, or change permissions without your approval. Use copies or test files when a real action could affect another person or system.

If a trial becomes unsafe or you do not have the needed access, stop. Keep what you tried and say why you stopped.

Required sections

1. The work I tried

In a few sentences, describe the task you chose from Assignment 1. Say what finished result you wanted. You do not need to repeat the Assignment 1 tables.

Do not choose confidential data, a high-stakes decision, or a tool you cannot actually use.

2. First trial: prompts and results

Run the Agent at least once with a real tool, such as web search, a browser, or files.

Keep the **full prompts** you used and the **Agent's output** (or a complete screenshot of the run). Do not replace them with a summary.

If the Agent produced a plan, keep that as well.

3. A second try (encouraged)

If you have time, change something and run it again. For example, make the prompt more specific, give a better source, or add a check.

Keep the **full prompts** from this run and the **result**.

If you only ran the Agent once, say in a few lines what you would change next time.

4. Summary

Write a short summary of what mattered.

Which **steps** or **prompts** made an important difference to the output? Be specific: point to a line you added, a constraint you set, a source you provided, or a check you asked for, and say how the output changed.
